CompoundIQ — Clinic Onboarding Playbook

Version: 2.0 | **Date:** April 9, 2026 **Audience:** CompoundIQ operations team, clinic administrators

---

Overview

This playbook walks through every step of onboarding a new clinic onto the CompoundIQ platform — from initial setup through their first successful order. Follow these steps in order. Each step has a verification checkpoint before moving to the next.

Estimated total time: 30–45 minutes (with clinic admin present for Stripe onboarding)

Pre-Onboarding Requirements

Before starting, confirm the following with the clinic:

- [ ] Clinic name and business address
- [ ] Clinic admin email address (will be their login)
- [ ] At least one provider with a valid NPI number and state license
- [ ] At least one medical assistant who will use the platform daily
- [ ] Clinic logo file (PNG or JPG, for patient checkout branding)
- [ ] Clinic contact phone number and/or email (displayed on patient checkout)
- [ ] Bank account information ready for Stripe Connect onboarding
- [ ] Understanding of the per-transaction platform fee model (15% of margin spread)

Step 1 — Create the Clinic Record

Who does this: CompoundIQ ops team

1. Log in to the Ops Dashboard as ops_admin
2. Create the clinic record in Supabase with:
   - `name` : Clinic's full business name
   - `stripe_connect_status` : PENDING
   - `logo_url` : Upload the clinic's logo to Supabase Storage and set the URL
3. Note the generated `clinic_id` UUID — this will be needed for user creation

Verification: Clinic appears in the clinics table with status PENDING.

Step 2 — Create User Accounts

Who does this: CompoundIQ ops team

Create Supabase Auth users for each clinic team member:

Clinic Admin

```
Email: [clinic admin's email]
Password: [generate a strong temporary password]
```

```
user_metadata: {
  app_role: "clinic_admin",
  clinic_id: "[clinic_id from Step 1]"
}
```

Provider(s)

```
Email: [provider's email]
Password: [generate a strong temporary password]
user_metadata: {
  app_role: "provider",
  clinic_id: "[clinic_id from Step 1]"
}
```

Also create a provider record in the `providers` table:

- `clinic_id` : from Step 1
- `npi_number` : Provider's 10-digit NPI
- `name` : Provider's full name
- `credentials` : MD, DO, NP, or PA

Medical Assistant(s)

```
Email: [MA's email]
Password: [generate a strong temporary password]
user_metadata: {
  app_role: "medical_assistant",
  clinic_id: "[clinic_id from Step 1]"
}
```

Verification: Each user can log in at `/login` and lands on `/dashboard`. Send temporary passwords securely (not via email — use a secure channel).

Step 3 — Stripe Connect Onboarding

Who does this: Clinic admin (with CompoundIQ ops support)

This is the critical step that enables the clinic to receive patient payments.

1. The clinic admin logs into CompoundIQ
2. They will see a banner: "Stripe onboarding must be completed" and the "+ New Prescription" button is disabled
3. Navigate to Settings or click the Stripe onboarding banner
4. Click "Set Up Payments" — this redirects to Stripe's hosted Express onboarding flow
5. The clinic admin completes Stripe's requirements:
   - Business information (legal name, EIN/SSN, address)
   - Bank account for payouts
   - Identity verification
6. After completion, Stripe redirects back to CompoundIQ
7. The system receives an `account.updated` webhook from Stripe

8. If `charges_enabled = true` AND `payouts_enabled = true` AND no outstanding requirements:
    - `stripe_connect_status` transitions to **ACTIVE**
    - The "+ New Prescription" button becomes enabled
    - The clinic is ready to create orders

If Stripe requires additional information:

- `stripe_connect_status` transitions to **RESTRICTED**
- New order creation is blocked
- Existing orders continue processing
- The clinic admin sees a banner with specific requirements from Stripe

Verification: `stripe_connect_status = ACTIVE` in the clinics table. The "+ New Prescription" button is enabled on the dashboard.

Step 4 — Configure Clinic Settings

Who does this: Clinic admin

1. Navigate to **Settings** in the Clinic App
2. **Upload clinic logo** — This appears on the patient checkout page for white-label branding
3. **Set default markup percentage** — e.g., 2.0 for 2x markup. This pre-populates the Margin Builder for all MAs
4. **Verify clinic contact info** — Phone/email displayed on patient checkout success page

Verification: Logo appears in settings. Default markup is set.

Step 5 — Verify Pharmacy Access

Who does this: CompoundIQ ops team or clinic MA

1. Log in as the medical assistant
2. Click "+ New Prescription"
3. Select the patient's shipping state (e.g., TX)
4. Search for a common medication (e.g., "Semaglutide")
5. Verify pharmacy results appear with:
    - Pharmacy names
    - Wholesale pricing
    - Integration tier badges
    - Turnaround times

If no results appear:

- Verify pharmacies have active state licenses for the selected state in `pharmacy_state_licenses`
- Verify catalog items exist for those pharmacies
- Verify pharmacy `regulatory_status = ACTIVE`

Verification: At least one pharmacy appears in search results with correct pricing.

Step 6 — First Test Order (Internal)

Who does this: CompoundIQ ops team with clinic admin observing

Walk through the complete order flow to verify everything works:

1. **MA selects patient & provider:**
   - Click "+ New Prescription" on the dashboard
   - Search for the test patient and select them
   - Provider auto-selects (or select from the list)
   - Click "Continue to Pharmacy Search"
2. **MA configures medication:**
   - Patient shipping state is auto-filled from the patient record
   - **Option A (Quick):** Click a Provider Favorite for one-click load, or apply a Protocol Template to add multiple medications at once
   - **Option B (Full):** Search by ingredient name → cascading dropdowns (salt form → formulation → dose/frequency/timing/duration) → select pharmacy → set retail price. The structured sig builder auto-generates prescription directions with unit conversion.
   - For titration protocols (e.g., LDN): toggle Titration mode and set start dose, increment, interval, target
   - Choose one of three options:
     - **"Add & Search Another"** — to add more prescriptions for the same patient
     - **"Review & Send"** — to go to batch review and sign
     - **"Save as Draft"** — to save for the provider to sign later
3. **Provider signs (two options):**
   - **Option A (same session):** Click "Review & Send" → provider reviews drug interaction alerts (if any) → signs on the batch review page → if controlled substances present, completes EPCS 2FA (TOTP code from authenticator app) → all prescriptions sent at once
   - **Option B (draft flow):** MA clicks "Save as Draft" → provider logs in later → opens the "Drafts" tab on the dashboard → clicks the draft → clicks "Review & Sign This Prescription" → signs and sends
4. **Verify order created:**
   - Order appears on dashboard as "Awaiting Payment"
   - Generate checkout URL: `npx dotenv -e .env.local -- npx tsx scripts/get-checkout-url.ts`
   - Three SLA timers created (24h reminder, 48h reminder, 72h expiry)
5. **Complete test payment:**
   - Open the checkout URL in a new tab
   - Verify clinic branding appears
   - Pay with Stripe test card: `4242 4242 4242 4242`
   - Verify success page displays correctly
6. **Verify fulfillment triggered:**
   - Order transitions to PAID_PROCESSING
   - Prescription routed to pharmacy via the appropriate tier
   - Adapter submission logged

Verification: Full order lifecycle completes without errors.

Step 7 — Train the Team

Who does this: CompoundIQ ops team with clinic staff

Medical Assistant Training (15 minutes)

Walk the MA through:

1. Logging in and navigating the dashboard
2. Using **Provider Favorites** — one-click reorder for common prescriptions
3. Using **Protocol Templates** — one-click multi-medication bundles (e.g., "Weight Loss Protocol")
4. Creating a new prescription via the cascading dropdown builder (ingredient → salt form → formulation → dose → frequency → timing → pharmacy → price)
5. Using the **Structured Sig Builder** — timing, duration, titration mode, cycling mode
6. Understanding status badges and SLA indicators
7. Saving drafts for the provider to sign later
8. What happens after they send the payment link (automated reminders, expiry)

Provider Training (10 minutes)

Walk the provider through:

1. Receiving a signature request
2. Reviewing order details and **drug interaction alerts**
3. Understanding the **controlled substance warning banner** (DEA Schedule II-V)
4. Signing with the digital signature pad
5. Completing **EPCS Two-Factor Authentication** for controlled substances (set up TOTP authenticator app, enter 6-digit code)
6. Understanding that their NPI and signature are locked after signing
7. Saving configurations as **Provider Favorites** for one-click reorder

Clinic Admin Training (10 minutes)

Walk the admin through:

1. Revenue dashboard — viewing payouts, margins, order history
2. Settings — logo, default markup
3. Stripe Connect — checking payout status
4. What to do if Stripe status becomes RESTRICTED

Step 8 — Go Live

- [ ] All user accounts created and tested
- [ ] Stripe Connect status = ACTIVE
- [ ] Clinic logo uploaded
- [ ] Default markup configured
- [ ] First test order completed successfully
- [ ] MA trained on daily workflow

- [ ] Provider trained on signature flow
- [ ] Admin trained on settings and revenue
- [ ] Emergency contact exchanged (CompoundIQ ops phone/email)
- [ ] Clinic understands the platform fee structure

The clinic is now live on CompoundIQ.

Post-Onboarding Support

First Week Check-In

After the first week, schedule a 15-minute check-in:

- How many orders have been created?
- Any issues with the workflow?
- Any pharmacy results missing or incorrect?
- Any patient payment issues?
- Feedback on the margin builder and pricing tools

Ongoing Support

Need	How to Get Help
Order stuck in a status	Contact ops — we monitor the SLA dashboard
Payment issue	Contact ops — we can check Stripe Connect status
New provider needs an account	Contact ops — we create the user and provider record
Catalog pricing seems wrong	Contact ops — we can check catalog version and sync status
Technical issue or bug	Contact ops — we escalate to engineering

---

Troubleshooting Common Onboarding Issues

Issue	Cause	Fix
User can't log in	Wrong password or email	Reset via Supabase Auth dashboard or seed script
"+ New Prescription" disabled	Stripe Connect not ACTIVE	Complete Stripe onboarding or check for outstanding requirements
No pharmacies in search results	No licensed pharmacies for selected state	Verify pharmacy_state_licenses entries
Margin builder shows $0 wholesale	Catalog not loaded for pharmacy	Upload catalog CSV or trigger API sync
Patient didn't receive SMS	TWILIO_ENABLED=false (POC) or phone number issue	Verify Twilio is enabled and phone number is valid

Provider can't sign	Signature pad not rendering	Clear browser cache, try a different browser
Stripe payout failed	Bank account issue on Stripe side	Clinic admin checks Stripe Express dashboard
